

How to build a **lovable** Product

Agenda

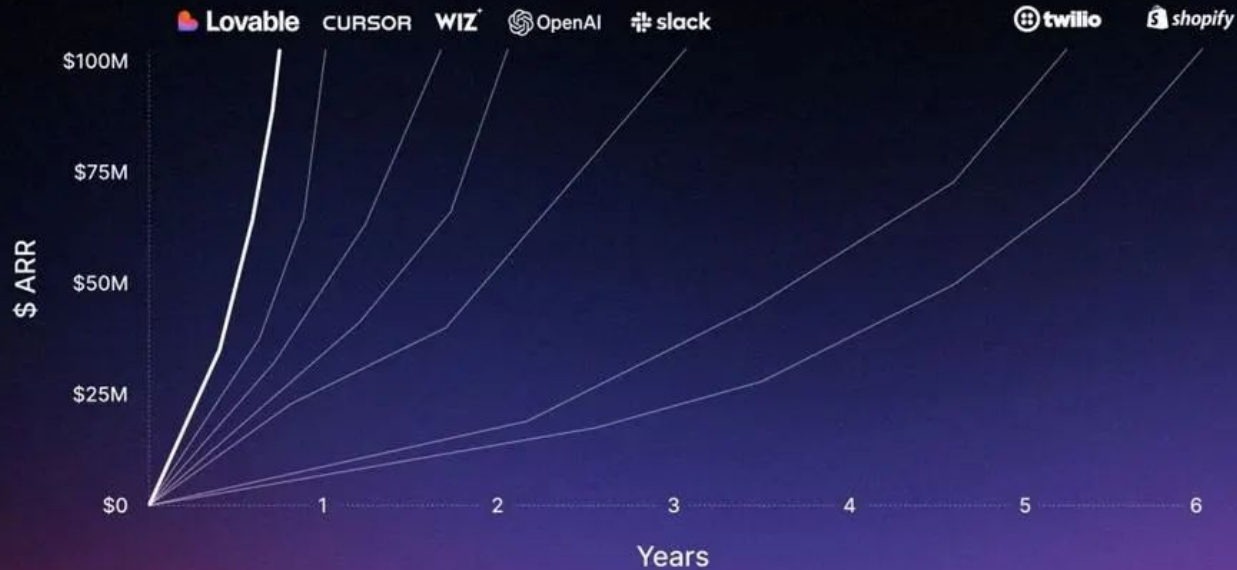

- 1 **The Problem**
- 2 **The People**
- 3 **User Research**
- 4 **Insights to Execution**
- 5 **It's never done!**

Story Time

This guy
built World's
Fastest growing
SAAS product ever.

Fastest \$1M → \$100M

Anton is a doer!

While the world was discussing whether AI is real or hype,
Anton was busy building

built

GPT Engineer

And then
built

Getting Started

Install gpt-engineer

For stable release:

- `python -m pip install gpt-engineer`

For development:

- `git clone https://github.com/gpt-engineer-org/gpt-engineer.git`
- `cd gpt-engineer`
- `poetry install`
- `poetry shell` to activate the virtual environment

We actively support Python 3.10 - 3.12. The last version to support Python 3.8 - 3.9 was [0.2.6](#).

Setup API key

Choose one of:

- Export env variable (you can add this to `.bashrc` so that you don't have to do it each time you start the terminal)
 - `export OPENAI_API_KEY=[your api key]`
- .env file:
 - Create a copy of `.env.template` named `.env`
 - Add your `OPENAI_API_KEY` in `.env`
- Custom model:
 - See [docs](#), supports local model, azure, etc.

Check the [Windows README](#) for Windows usage.

Other ways to run:

- Use Docker ([instructions](#))

- Do everything in your browser:

Open in GitHub Codespaces

Anton Found

- People wanted to build product and businesses, but don't have technical expertise.
- His non-tech friends frequently asked him for references for tech co-founders.
- But getting tech co-founders wasn't easy!
 - Discovery
 - Unproven idea
 - Cost
 - Time

Validation ✨

User Research

Identify Users: Non tech founders | Developers | Designers | Hobbyists.

Needs: Building working software quickly without tech know-how.

Pain points:

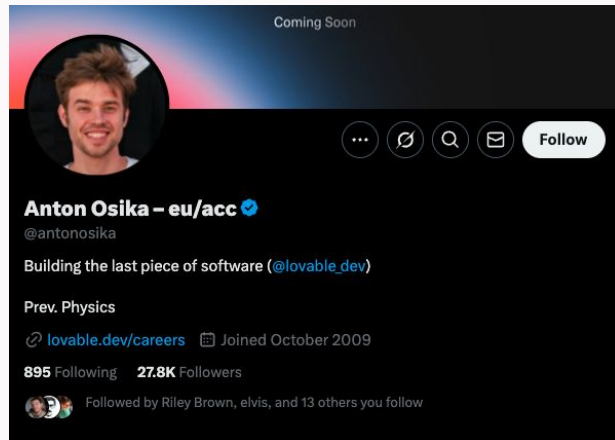

- Good Developers are costly, take time and difficult to find.
- Current AI solutions are built for code generation, code editing and need some technical expertise.
- Current AI solutions are difficult to set-up.
- People want speed with granular control.

Apprehensions:

- AI output isn't reliable.
- Such products can't be deployed at scale.
- Codebase cannot be controlled precisely.

Interview Questions

Background & Current Process:

"Can you walk me through how you currently build a new app or **feature**? (If using Lovable, how did you use it in your last project? If not, what tools do you use?)"

Needs & Goals:

"What are your main goals when you set out to build an application?" (e.g. validate an idea quickly, save development cost, etc.)
"What does 'success' look like for you using a tool like Lovable?"

Feature Desires:

"If this AI tool could offer you three additional features or superpowers, what would they be?"

Is there anything you wish Lovable would do differently or better to fit your workflow?"

Pain Points & Challenges:

"What are the biggest challenges or frustrations you've encountered in building applications (with or without Lovable)?"

If the user has used Lovable: "Were there moments when Lovable (or the AI builder) didn't meet your expectations? What happened, and how did you work around it?"

Experience with GenAI:

"How has the experience been using an AI-powered tool? Do the AI's outputs align with what you expect? If not, what's usually missing or off-target?"

"Overall, how much do you trust the code or designs generated by the AI?"

Wrap-up

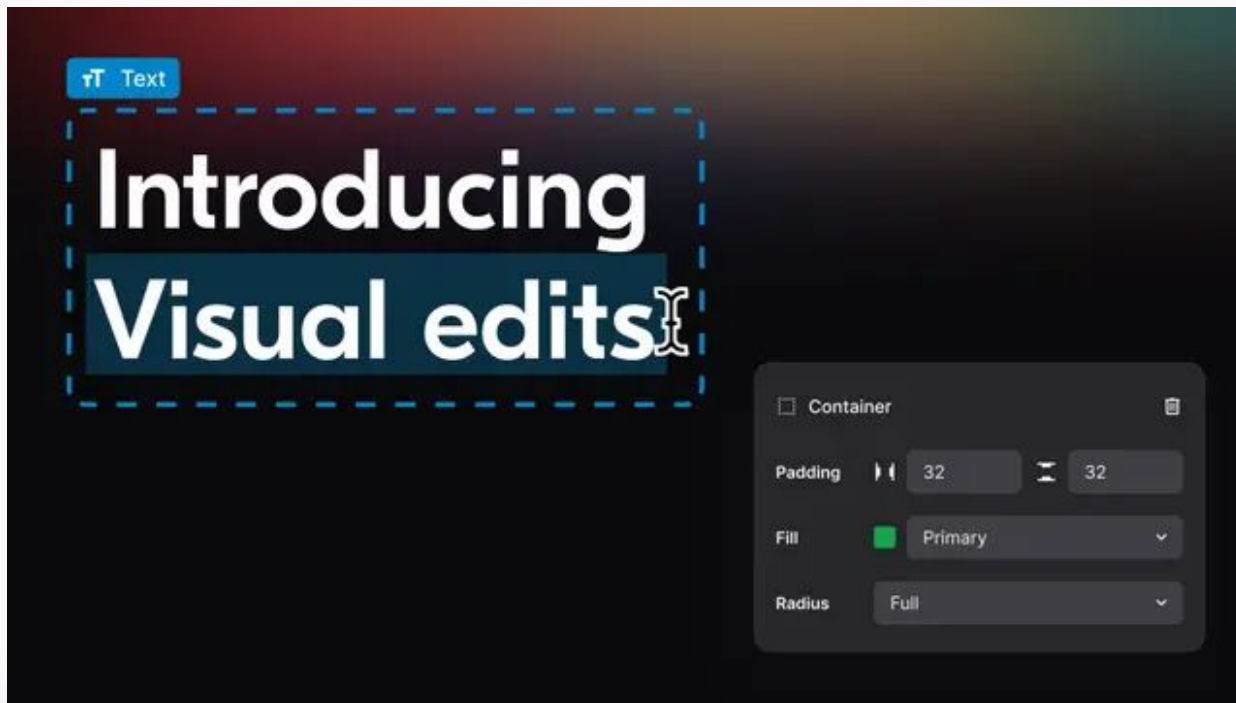

Any other thoughts or feedback on your experience with Lovable or AI app builders in general? Is there a question you expected us to ask that we didn't?"

INSIGHTS

- 1 Users love speed and ease but demand control.**
- 2 Product must deliver as soon as possible.**
- 3 Users need social proof.**
- 4 Users need working software and not just UI or code.**
- 5 Users want to see behind the scenes.**
- 6 Different users need different nuanced value.**

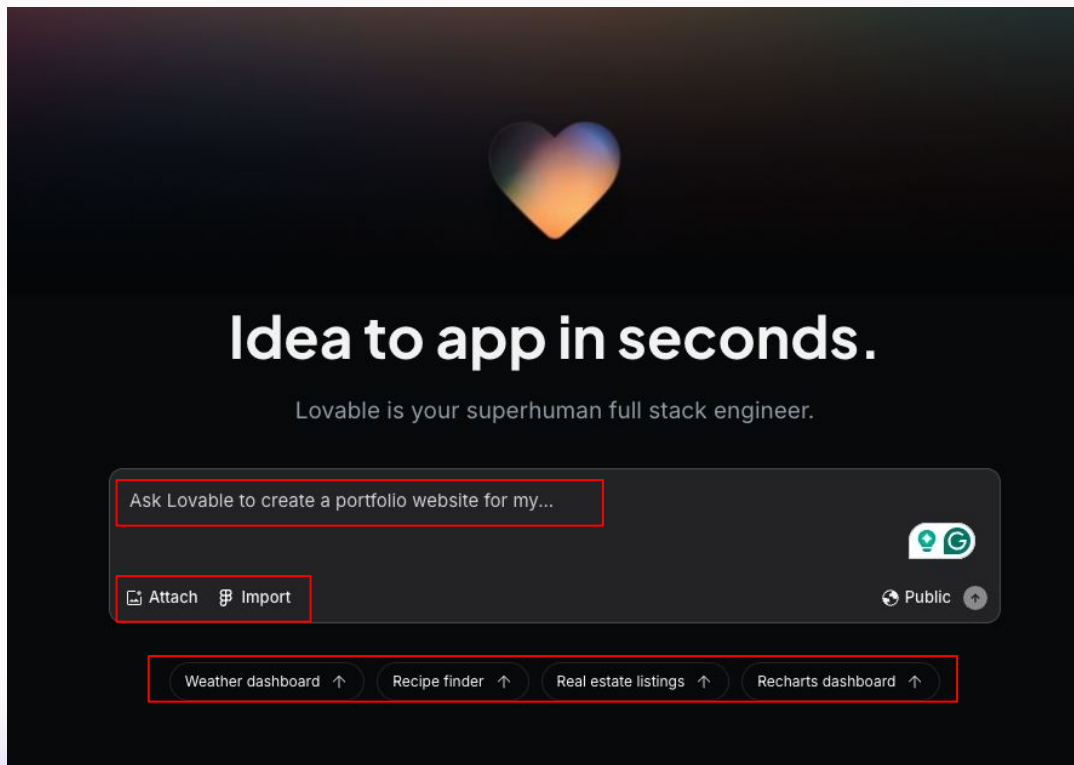

✨ INSIGHTS TO FEATURES

- 1 Users love speed and ease but demand control.

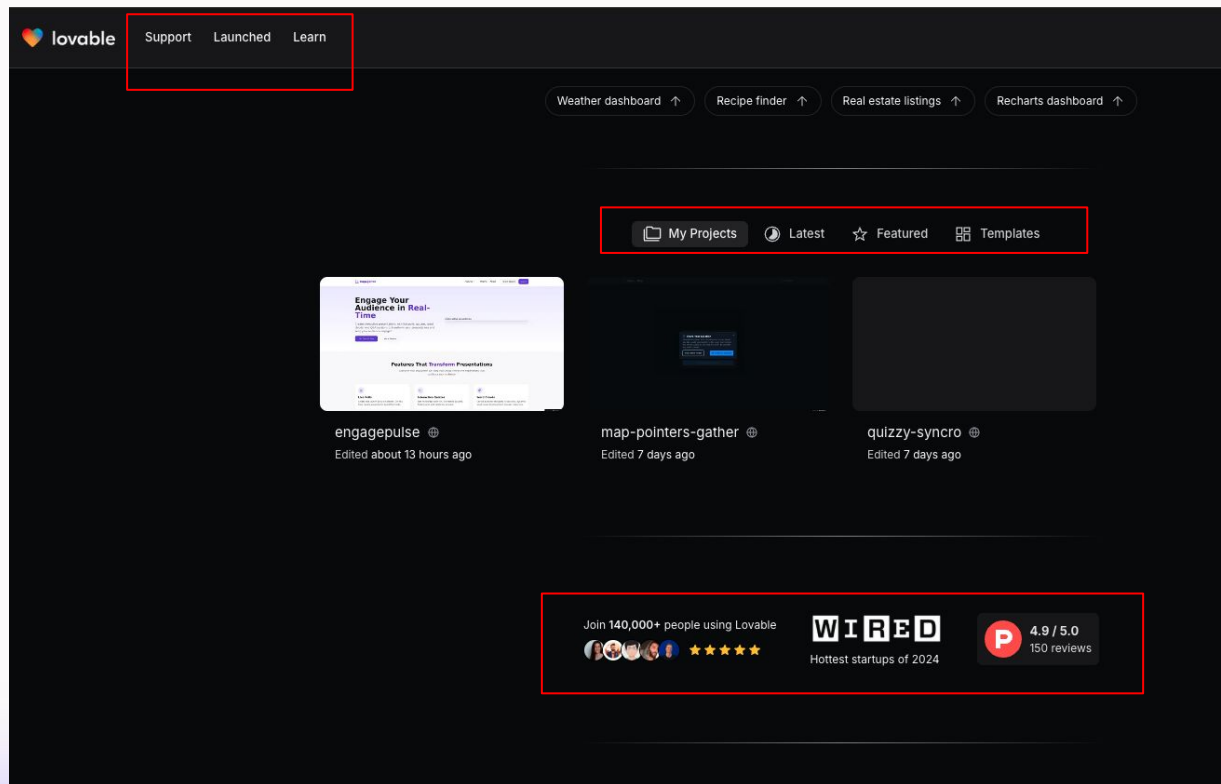

INSIGHTS TO FEATURES

2 Product must deliver as soon as possible.

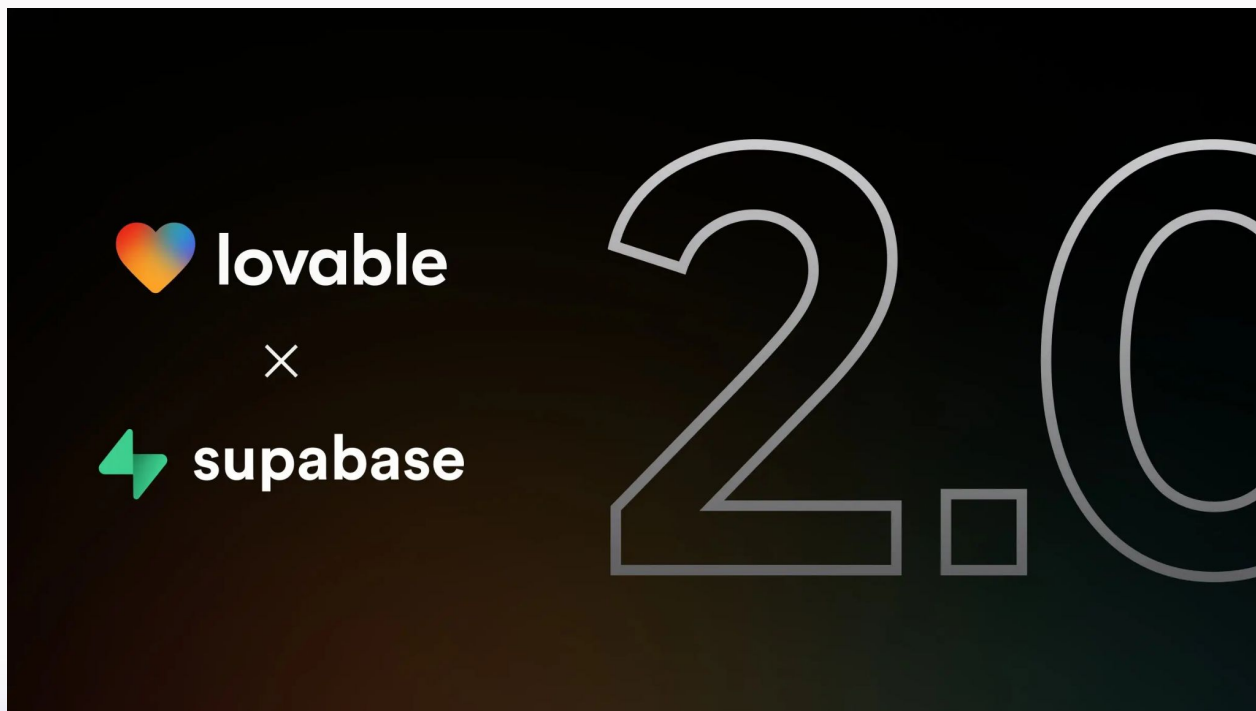

3 Users need social proof.

✨ INSIGHTS TO FEATURES

- 4 Users need working software and not just UI or code.

INSIGHTS TO FEATURES

5 Users want to see behind the scenes.

The screenshot displays the EngagePulse IDE interface. On the left, a dark-themed sidebar contains a list of features: "advanced AI features.", "GitHub Sync: Transfer your project's code to GitHub for two-way sync of edits.", "Debug with Ease: Activate our experimental 'chat mode' to troubleshoot issues quickly.", and "Add project knowledge: Set key context or custom instructions you want to include in every edit in this project." Below this list are buttons for "Visit docs", "Explore Supabase", and "Manage knowledge". An "Error" panel shows a message about a "button" component. The main workspace is split into two panes. The top pane shows a code editor with a "Code viewer" button. The bottom pane shows a preview of the "EngagePoll" application. The preview has a header with the "EngagePoll" logo and navigation links for "Pricing", "About", "Join Session", and "Sign In". The main content area of the preview features the heading "Engage Your Audience in Real-Time" and a subheading "Create interactive presentations with live polls, quizzes, word clouds, and Q&A sessions to transform your presentations and keep your audience engaged." A sidebar menu on the right of the preview lists the following routes: "Index /", "JoinSession /join", "Auth /auth", "Dashboard /dashboard", "Session /session/:sessionId", and "CreatePresentation /create".

It's Never Done!

Agent Mode (Beta)

Enabling Lovable to think, plan, and take actions autonomously.
